Should dispatch spend $800 on a backup carrier tomorrow?

Optional take-home case · Start in the student kit's monday folder

Choose the job

The dispatcher needs one call before tomorrow's shipments. Read dispatch-brief.txt. Write the decision your agent can prepare and who can approve the spend.

Count it yourself

Use dispatch.csv and the 85% threshold. Define what counts as on time. Save your counts, your first call and the question you'd ask the contract owner.

Hear the owner

Now open dispatch-owner.txt. Keep your first answer. Write the agreed definition, rerun the count and tell the dispatcher what to do for one day.

Test the next run

Give a colleague your rule and the CSV. Compare both calls with dispatch-review.txt. Test a duplicate scan and a promise still open. Who reviews the next group before any more money is spent?
