Can Finance use the agent on Monday?

Finance wants to explain weekly activation variance. Bring the release decision from the eval lab. The critical tests must pass, and an independent reviewer must support at least 18 of 20 answers. What evidence do you have for this team?

A small pilot earns a recurring run

Track preparation time, review effort, numerical errors and decision follow-through.

Set the base

One decision, one metric owner and one frozen weekly packet.

Repeat the run

Run it again on the same data and compare the results.

Test the edges

Feed it stale and incomplete inputs and see what it does.

Approve and reuse

The owner approves the brief. A fresh session must reuse a correction.

Schedule

Only then put the run on a recurring schedule.

How many requests received a rating?

Week A: 18 positive out of 20 rated, from 100 requests.

Week B: 10 positive out of 10 rated, from 100 requests. The other 90 week-B requests tell us nothing about satisfaction.

Check the independent audit before advising Finance.

Read a sample outside the feedback inbox

Independent reviewers supported **18 of 20** sampled answers in week A and **14 of 20** in week B. Use both denominators. What can you decide with these samples, and what would you investigate next?

Follow one complaint all the way back

Product Data owns F04. Keep the failed reply in the review record. Have a reviewer approve the aggregate-only rule, then test the original request and one with a different synthetic ID. Close F04 only if neither reply repeats an identifier. The rollout decision still depends on the full audit.

Who can stop the pilot?

Write down the team you'd let in, who can pause access and which version they'd restore. Put the next audit on the calendar. What still needs fixing before you invite a second team?

What exactly can one planner do next week?

Read the Finance owner’s audit after making your first call. Which build, team and report does it cover? Write the instruction you’d send Monday. Name who can pause use, what happens to an unsupported answer, and when a fresh audit is due.

Show a colleague what you built

Start a fresh conversation. Show one approved metric, one decision you challenged and one correction that changed a later answer. Everything you need to keep working is in the **course GitHub repository**.
