Would you want this answer in your weekly review?

“Always give your best estimate” sounds helpful until the question is “How active are we?” Try it. Underline the assumption your agent made on the user’s behalf.

Four requests, four different jobs.

A defined metric needs an answer. An ambiguous metric needs a question. Impossible counts need an owner to review them. A request to put a customer email in a public bug report calls for a refusal and an aggregate alternative.

Test the broken row.

Suppose 24 accounts activated out of 20 eligible accounts. A model can divide those numbers. What would you want your analyst to do before anyone sees the resulting percentage?

24 activated

20 eligible

Keep the actual words.

Run each request separately. Save the reply, the action it took and the evidence it cited. A reply can say “Review” in its heading and still make an unsupported recommendation in the next sentence.

Trade one failure with a partner.

Ask your partner to make the smallest change that fixes the bad answer. Rerun the other cases. Did fixing one request make the analyst less useful on another?
