Growth wants employees excluded. Finance wants last year’s numbers.

Both teams have a reasonable request. Which metric should change? Which consumer gets to keep the old one?

Read the change in ordinary language.

The current definition includes every eligible account. The proposed definition includes eligible external accounts.

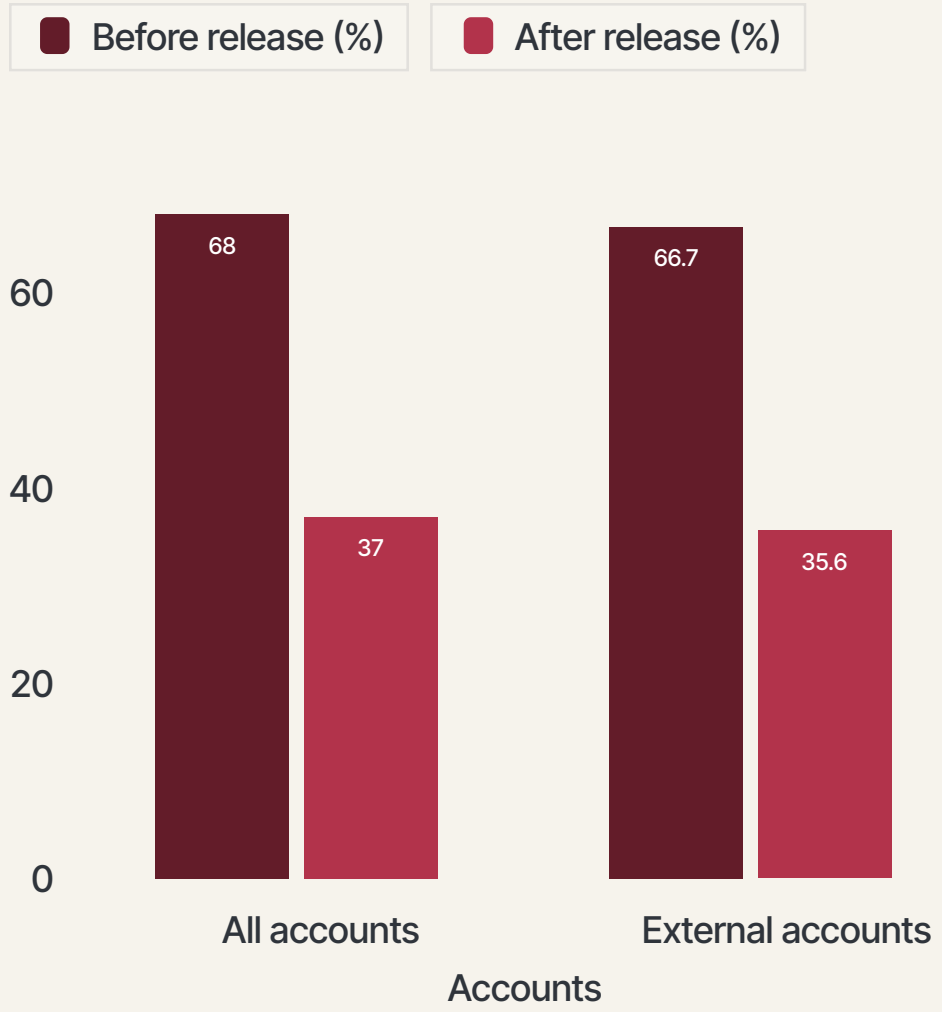

Name it activation_external_7d so someone reading an old report can still tell what it measured.

Run both definitions on the same periods.

Before the release, all accounts gave 680/1,000. External accounts gave 600/900.

After the release the counts are 370/1,000 and 320/900.

Show both lines to the people who depend on them.

Now 100 accounts have no audience label.

Open org/drift.csv. The calculation can still return a number.

Would you certify that number as the external activation rate? Who can resolve the missing classifications?

Check that your source is still current.

Compare the extract’s fingerprint with the steward’s receipt in org/snapshots.csv.

Was the source less than one day old when the decision was made?

Try the check after changing one count.

Sign a decision for each consumer.

Who owns the new definition? Which report can migrate? How would Finance recover the old series?

Put the answers next to the proposed effective date in work/model-release.md.
