2. Would you roll back Tuesday's release?

Sai gives the first answer from the approved model and activation.csv.

Paras, engineering lead, asks:

"Are you telling me to roll this back?"

Pause. Write one sentence answering Paras. Keep your answer private until debrief.

Worked example: the rates rose, the total fell

ACTIVATION.CSV · COUNTS AND ACTIVATION RATES

SEGMENT	BEFORE	AFTER	RATE CHANGE
Returning	640/800 = 80%	170/200 = 85%	80% → 85%
New	40/200 = 20%	200/800 = 25%	20% → 25%
Overall	**680/1000 = 68%**	**370/1000 = 37%**	**68% → 37%**

+5 pp

Within both segments

Each segment's activation rate rose.

−36 pp

Mix effect

Shifting segment weights lowered the total.

73%

At original weights

The later rates, using the original mix.

Instructor cue · Write the three numbers on the board. Ask which one answers Paras.

SOURCE: ACTIVATION.CSV · CLASSROOM SYNTHETIC DATA · PP = PERCENTAGE POINTS

EVIDENCE BOUNDARY · CLASSROOM SYNTHETIC DATA

Observable before/after: arithmetic versus causality

WHAT ACTIVATION.CSV SUPPORTS, AND WHAT REMAINS UNKNOWN

Supported by the data	Not supported by this before/after
Overall 68% → 37% The observed aggregate rate fell.	**The release effect remains unknown.** A before/after difference does not identify what the release caused.
Both segments +5 points Rates rose within Returning and New.	**The rollback effect remains unknown.** These observations do not establish what reversing the release would do.
Mix −36 points · Reweighted 73% The decomposition and original-weight calculation are arithmetic.	**Needed: exposure data and a credible counterfactual.** Establish who received the release and a defensible comparison for what would otherwise have happened.

Instructor cue · Point at each row and ask "arithmetic or causal claim?"

Timed build: 12 minutes

12

Minutes

Work on your own copy of synthetic activation.csv.

Use the approved model.

COPYABLE PROMPT

> Using activation.csv and the approved model, decompose the overall rate change into within-segment and mix effects. Report the rate at original weights. State what the data cannot say about the release or a rollback, then request the exposure data and counterfactual you need.

Write your deliverable

Produce a three-sentence proof plus the next evidence request. Keep your answer for peer review; answers stay off this card until debrief.

Peer challenge

Swap proofs with a partner for 5 minutes.

CHALLENGE THE CLAIM

Find one sentence that slips into unsupported causality.

Look for the point where correct arithmetic becomes a claim about what caused the result.

CHALLENGE THE REQUEST

Find one evidence request that is vague.

Mark the wording that leaves your partner's next evidence need unclear.

SAY OR DO

"What would have to be true for this to be causal?"

Read your partner's sentence aloud. Ask the question. Mark the proof and return it.

PEER CHALLENGE · NO ANSWERS SHOWN UNTIL DEBRIEF

SAVE BEFORE LEAVING

Exit artifact

Save a three-sentence proof and your next evidence request.

State the arithmetic.

Use sentence 1 to state the result of your calculation.

State what it does not show.

Use sentence 2 to make the limit of the evidence explicit.

Name the evidence you would ask Paras for.

Use sentence 3 for your next request: exposure data and a credible counterfactual.

Submit as a saved file. Keep the proof and evidence request together.

Debrief reveals the model answer next.
