ORG MODEL CHANGE LAB · 9–10 AM

Who can change the activation metric?

Negotiate the source, owner, access, freshness and downstream dependencies of one metric.

Classroom synthetic data · 60 minutes in total

Growth, Finance and Engineering each define activation differently

1 **Growth: exclude employee test accounts**

Growth wants employee test accounts excluded from the activation count.

2 **Finance: keep the historical series**

Finance needs the historical series so the monthly report stays comparable.

3 **Engineering: owns the flag**

Engineering owns the feature flag that decides which users reach the onboarding path.

Negotiation grid for each metric: source · owner · access · freshness · downstream dependencies

MINUTES 10–20 · BRIDGE

The synthetic bridge: totals, internal and external, before and after

Measure	Pre (R16 extract)	Post (R17 extract)
Total activated / all users	680 / 1000	370 / 1000
Internal activated / internal users	80 / 100	50 / 100
External activated / external users	600 / 900 = 66.67%	320 / 900 = 35.56%

Synthetic classroom figures. Denominators: 1000 total, 100 internal, 900 external.

MINUTES 20–40 · BUILD AND CHANGE REVIEW

Keep activation_7d v1 and build the external candidate beside it

1 **Keep activation_7d v1 unchanged**

It stays the live metric while the candidate is compared.

2 **Build the OSI metric in a separate eligible-by-audience dataset**

Run the parallel definitions side by side and log every difference.

3 **Map every consumer**

WBR dashboard, onboarding agent and Finance report, each with its owner.

4 **Write the cutover and fallback document**

State when the switch happens and how to return to v1.

MINUTES 40–52 · INJECT

A second extract has an unknown audience for 100 eligible users

The facilitator releases the second extract. The audience field is unknown for 100 of the eligible users.

Certification is blocked. Send the remediation request to the data owner before any candidate is compared again.

MINUTES 52–60 · SIGN OR HOLD

Publish activation_external_7d only as a named candidate, after signatures

Compare the candidate with v1, then collect the owners' signatures. If any signature is missing, the team holds.

Decision: sign with the named owner, or hold with the blocking item written down.

Each team leaves with five artifacts

1 **Versioned candidate**

activation_external_7d, named and versioned.

2 **Impact table**

The bridge figures, with denominators stated.

3 **Owner**

One named owner for the metric.

4 **Freshness requirement**

How current the extract must be before use.

5 **Rollback plan**

The fallback to activation_7d v1.

DEBRIEF · SEPARATE FROM THE EXERCISE · NOT TIMED

Debrief: what the lab asked you to decide

1 **Which owner did you need to convince, and why?**

2 **Which denominator changed your reading of the bridge?**

3 **What would have made you hold rather than sign?**
