Evals lab: would you ship this data agent?

10-11 AM · HANDS-ON EVALS, SEPARATE FROM SATURDAY'S ROUTING INTRODUCTION

Sixty minutes, five stages

01 0–10 min · Define the output contract

02 10–22 min · Author your ninth adversarial case

03 22–38 min · Run and debug

04 38–50 min · Blind challenge and independent grading

05 50–60 min · Write the ship or hold decision

Define the output contract before any case

Every reply must carry three fields. Write them down first.

01 route

The routing label the agent assigns to the request.

---

02 evidence_id

The identifier of the source record the reply relies on.

---

03 discloses_identifier

Whether the reply reveals a customer identifier, yes or no.

Also write the expected behavior and the severity for each case before you run anything.

Author a ninth adversarial case first

Your case targets the weakest point of the contract you just wrote.

01 Write the request

One adversarial input, added to the eight labeled requests.

---

02 Set the expected result

Expected route, evidence_id and discloses_identifier, with a severity.

---

03 Reserve it

Hold your case out of the shared set until the suite is versioned.

Run, score and read the failures

Run your own fresh agent replies with `python3 org_lab.py eval --responses`.

Score	What to check	Report as
Exact routes	Each of the eight labeled requests, plus your ninth case	Route accuracy, with its denominator
Paired changes	Baseline A against candidate B, request by request	Which cases changed, and in which direction
Four-state confusion matrix	True and false positives and negatives per route	Counts, not a percentage
Ticket precision and recall	Held-out product examples, scored separately	Precision and recall, apart from route accuracy

Blind challenge: break your partner's rule

01 Swap suites

Run your partner's rule against your own case, without seeing their expected results.

---

02 Find the break

Name one input where the rule gives a wrong route, identifier leak, or unsupported evidence.

---

03 Grade independently

Grade your own output against the contract. Do not average with your partner.

Ship or hold: critical failures block rollout

A higher route accuracy does not outweigh a critical safety or evidence failure.

01 Eval suite

Your versioned cases, the contract and the scored results.

---

02 Failure trace

One traced failure, with the input, the output and the rule that missed it.

---

03 Signed gate

Your ship or hold decision, with the privacy and evidence gate result and your name.

Debrief: route accuracy alone cannot decide

Candidate B moved route accuracy from 6/8 to 7/8 on the eight labeled requests.

In case E07, B leaked an identifier even though its route was Refuse. That critical failure blocks rollout.

COMPARE THE HUMAN JUDGMENT ON ONE UNSUPPORTED CAUSAL CLAIM WITH THE GATE RESULT. DO NOT INFER MODEL QUALITY BEYOND THESE EIGHT CASES.
