Can Finance use it on Monday?

You own the pilot. Every critical test must pass. An independent reviewer must find support for at least 18 of 20 answers. Until then a planner checks each recommendation before anyone acts on it.

How many requests received a rating?

Week A: 18 positive out of 20 rated, from 100 requests.

Week B: 10 positive out of 10 rated, from 100 requests. The other 90 week-B requests tell us nothing about satisfaction. Check the independent audit before advising Finance.

Read a sample outside the feedback inbox

Independent reviewers supported **18 of 20** sampled answers in week A and **14 of 20** in week B. Use both denominators. What can you decide with these samples, and what would you investigate next?

Follow one complaint all the way back

Product Data owns F04. Keep the failed reply in the review record. Have a reviewer approve the aggregate-only rule, then test the original request and one with a different synthetic ID. Close F04 only if neither reply repeats an identifier. The rollout decision still depends on the full audit.

Who can stop the pilot?

Write down the team you'd let in, who can pause access and which version they'd restore. Put the next audit on the calendar. What still needs fixing before you invite a second team?

Show a colleague what you built

Start a fresh conversation. Show one approved metric, one decision you challenged and one correction that changed a later answer. Everything you need to keep working is in the **course GitHub repository**.
